

# Vostochno-Messoyakhskoye field

The Vostochno-Messoyakhskoye field was discovered in 1990  
The northernmost onshore field in Russia

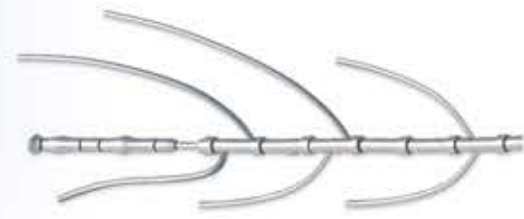

Recoverable reserves:  
**342.6** mt Oil and gas condensate  
**113,8** bcm Gas

Location:  
Yamalo-Nenets Autonomous Okrug

Depth of oil-bearing strata: 800 m  
One of the shallowest in Russia – with a horizontal section more than 1,000 m long

It is for precisely this reason that cutting-edge “fishbone” technology is being used

“Side-tracking” from the main horizontal section in fishbone wells makes it possible to develop shallow reservoirs – while enhancing oil recovery by up to 40%
